- Make sure Site Settings | Files | Server Timezone Difference is correctly set if your PC and remote server are in different timezones.

Time zone offset (= localtime - remotetime) for converting remote file time to local time.

- Set detailed view in Remote Browser Pance so that you can see the actual filetime TurboFTP sees.

- Enable Site Settings | Files | Preserve server file time on downloaded files.

- You can use Sync Scheme "Update and add new files to destination" with Sync Direction = BOTH to keep the local folder and remote folder having the most updated files even if files in both of them can be modified.
