- Make sure you have installed the Sync Service as NT service.
- Make sure you have start Sync Service as NT service though the scheduler dialog.
- Make sure you have not disabled the Scheduler.

If you are using a network share as the local folder, please read TurboFTP help document topic [Scheduled FTP | TurboFTP Sync Service | Managing logon credentials for accessing network shares in NT service mode] on how to set up to use a network share as local folder in a Sync Service task.

You can test a sync task by highlighting it in the Task Scheduler and hit the Run Now button.

If problem persists, please send us the task log.
