The TurboFTP Sync Service module is a module that allows you to run schedule tasks as a generic NT service, which means once you have configured and started the schedule tasks, no user logon is necessary to keep the jobs running. The Sync Service supports simultaneous multiple schedule tasks and offers better performance. Note that it can only be run as NT service on windows platforms that support it (Windows NT/2000/XP/2003 Server). The Sync Service module can also be run as a normal console program and accomplish an one-time FTP synchronization job or a group file transfer job by feeding appropriate command line parameters. If you don't need these features and advantages you can order TurboFTP without the Sync Service module. TurboFTP GUI program alone can also do scheduled FTP transfer and synchronization but can only do one job at a time and cannot run it as NT service without the Sync Service module.
