If you want to download multiple file using wildcard (e.g. *.*), the manual way is to right click the remote pane and select "Manual download" then enter "/path/*.*" in the dialog, hit OK. And an entry will be added to queue window (the bottom window) you can now start the transfer.

If you need to repeat this, save the queue to a TBX file after you enter the manual download entry as mentioned above by using menu Session | Save queue. Next time you can double click the saved TBX file to initiate the transfer again.
